## Backup and data recovery for any scenario

NinjaOne provides a flexible, easy-to-manage backup solution that helps you protect servers and workstations on any network against ransomware, disaster, or accidental loss. Fast, reliable recovery ensures you can restore data quickly while single-pane monitoring ensures you have complete visibility into backup status.

## Safeguard your endpoints with a layered security approach

NinjaOne helps you deliver on the fundamentals of endpoint security by offering a layered management approach emphasizing security and remediation. Get complete endpoint visibility, deliver endpoint hardening configurations, patch endpoints automatically, and ensure peace-of-mind through backup and recovery.

“Ninja works so well because so much of our daily IT operations tasks are automated for me. If I had to dedicate time to patching, monitoring, backup, reporting, etcetera, I would not be able to focus on strategic projects.”

**Jesse A,**  
IT Officer, Banking

“Ninja Data Protection has provided our technicians with an intuitive backup solution that allows them to focus more on supporting our clients and less on unreliable and disjointed backup systems. Having Ninja backup being built from the ground up and fully integrated into the Ninja platform is a huge benefit.”

**Jesse Vella,**  
Staff Supervisor, In-Shore Technologies

## Unmatched visibility for your endpoints

Experience complete control over end-user devices and servers, enabling you to set the foundation for endpoint security. Manage applications, deploy scripts, and mass-configure devices to promote endpoint security. Automated alerting ensures IT teams can proactively identify issues before they impact users.

## Take Control with a Single Click

Ninja enables you to manage any endpoint with an internet connection and support end users on- or off-network with a single click. Multiple remote-access options and stealth remediation tools ensure you can remediate issues across your endpoints and infrastructure quickly and confidently.

## We Simplify IT Operations

The IT management software space has long been dominated by complex, difficult-to-use, and siloed tools that lead to on-going hidden costs, bring technician workflows to a halt, and pose a security risk. NinjaOne replaces these legacy point-solutions with a natively integrated, 100% network- and location-agnostic IT management solution that enables teams to manage distributed users and endpoints securely.

### The Unified IT Operations Platform

The NinjaOne unified IT operations platform gives you everything you need to manage your users and endpoints from a single, centralized console, anywhere in the world.

Unlike siloed solutions, each NinjaOne solution interacts natively with the entire platform, giving a richer, more contextual view into end-user requests, endpoint health, infrastructure, and security.

NinjaOne gives you unparalleled visibility into and control over the entire infrastructure, operations, and support workflows, ensuring technicians are efficient, business users are productive, and employees are happy.

Centrally support and manage remote workers and endpoints

Reduce cost and improve satisfaction through proactive IT management

Automate time-consuming IT administration and remediation tasks

Utilize IT operations and support resources more efficiently

Improve security and compliance with a single-source-of-truth for IT management

### Why NinjaOne?

NinjaOne supports over 6,000 MSPs and IT departments around the world, and is consistently ranked #1 for it's world-class customer support. NinjaOne has been recognized as the best rated software in its category on G2 and Gartner Digital Markets for the past 3 years.
